F Fast delivery

- The load will create inertial forces (kinetic energy) when moving the load with Rotary Actuator. In order to stop the moving load, it is necessary to use stopper or Shock Absorbers to absorb the kinetic energy of load.
- The moving load with actuator can be distinguished as following
 1. Linear motion (air cylinder), Fig.(1)
 2. Rotation motion (rotary actuator), Fig.(2)
- Calculate the kinetic energy by using the formula in FIG.

Linear motion

Rotation motion

- For linear motion, if the velocity V of formula (1) is constant, the kinetic energy E and mass m is proportional; The rotation motion, formula (2) shows even the angular velocity ω and mass m is constant, kinetic energy E will also proportional with r^2 . Therefore, even the mass is small but the rotation radius r is large, when the moment of Inertia $I = m \cdot r^2$ is large, kinetic energy E will become larger, it will cause bearing damage or other accidents.
- Therefore when there is a rotation motion, the product selection should be based on moment of inertia instead of mass.

Moment of inertia

- Moment of inertia shows, it is not easy to rotate the stationary object; the same which means it is difficult to stop the rotating object.
- Rotary Actuators in the allowable kinetic energy has its limitations, it can be calculated moment of inertia to calculate minimum rotation of moment of inertia described as following.

Above figure represents the moment of inertia for the distance r from rotary shaft to mass m of the object. The formula for moment of Inertia is not the same if the shapes of the object are different. The following examples are the calculated on the basis of specific moment of inertia.

1. Thin shaft

Position of rotational axis: Perpendicular to the shaft through the shaft through the center of gravity.

2. Thin rectangular plate

Position of rotational axis: Parallel to side b and through the center of gravity.

Moment of inertia

ROTARY ACTUATOR

3. Thin rectangular plate (Including rectangular parallelepiped)

Position of rotational axis: Perpendicular to the plate through the center of gravity.

4. Round plate (Including column)

Position of rotational axis: Through the center axis.

5. Solid sphere

Position of rotational axis: Through the center of diameter.

6. Thin round plate

Position of rotational axis: Through the center of diameter.

7. Gear transmission

Use the following formula to calculate the rotation time

$$t \geq \sqrt{\frac{2 \cdot I \cdot \theta^2}{E}}$$

t : Rotation time (s)
 E : Kinetic energy (J)
 I : Moment of inertia ($\text{kg} \cdot \text{m}^2$)
 θ : Rotation angle (rad)

The meaning of this formula is the critical rotation time for not cause damage of the cylinder. Therefore the rotation time must be set on or over the t seconds calculated in above formula.

After calculated the moment of inertia by load shape, use the following formula to calculate the kinetic energy of the load.

$$E = \frac{1}{2} \cdot I \cdot \omega^2$$

E : Kinetic energy (J)
 I : Moment of inertia ($\text{kg} \cdot \text{m}^2$)
 ω : Angle speed (rad/s)

Angle speed

$$\omega = \frac{2\theta}{t} \dots (1)$$

$$\omega = \frac{\theta}{t} \dots (2)$$

t : Rotation time (s)
 I : Moment of inertia ($\text{kg} \cdot \text{m}^2$)
 θ : Rotation angle (rad)

However, when the rotation time for 90° becomes longer than 2 seconds, use formula (2).

Calculation example

Load form: Cuboid

Rotation angle θ : 180°

Rotation time t : 1 s/ 180°

Length of a part: 0.12 m

Length of b part: 0.06 m

Mass (m) : 0.1 kg

$$I = m \cdot \frac{a^2 + b^2}{12}$$

(Step 1) Find the angle speed ω .

$$\omega = \frac{2\theta}{t} = \frac{2}{1} \times \pi = 6.28 \text{ rad/s}$$

(Step 2) Find the moment of inertia I .

$$\begin{aligned}
 I &= m \cdot \frac{a^2 + b^2}{12} \\
 &= 0.1 \times \frac{144 \times 10^{-4} + 36 \times 10^{-4}}{12} \\
 &= 1.5 \times 10^{-4} \text{ kg} \cdot \text{m}^2
 \end{aligned}$$

(Step 3) Find the kinetic energy E .

$$\begin{aligned}
 E &= \frac{1}{2} \cdot I \cdot \omega^2 = \frac{1}{2} \times 1.5 \times 10^{-4} \times 6.28^2 \\
 &= 0.002958 \text{ J}
 \end{aligned}$$

Features

- Centering boss and locating hole for accurate positioning.
- Operating range of table is 0°~190° by angle adjusting screw
- Compact design using double rack and single pinion.
- Hollow shaft standard for wiring and piping.
- Possible to fit shock absorbers as stops.
- Ease of mounting with integral table.
- Magnetic as standard.

Order example

Auto switch type

Notice for shock absorber

- The threaded orifices shown below are not connecting ports. Never remove the plugs as this will cause malfunction.
- Never rotate the bottom screw of the shock absorber. (It is not an adjustment screw.) This may cause oil leakage.

Features

- 4 to 10 times more allowable kinetic energy**
(compared with internal shock absorber type)
- Total length shortened**
Longitudinal mounting space is reduced because there is no protrusion from adjustment bolts or internal shock absorbers.

Specification

Model	MCRQ-S		
Acting type	Double acting		
Tube I.D. (mm)	16	20	25
Port size	M5×0.8	Rc1/8	
Rotation	90°, 180°		
Medium	Air (Non-lube)		
Max. operating pressure	1 MPa (*1)		
Min. operating pressure	0.2 MPa		
Ambient temperature	0~+60℃ (No freezing)		
Allowable kinetic energy (J)	0.231	1.21	1.82
Rotation time adjustment range (s/90°)	0.2~1.0 (*2)		
Cushion	Shock absorber		
Shock absorbertype	MDSC-1008-3N	MDSC-1008-3N	MDSC-1412-3N
Angle adjustment range	Each rotation end ± 3°		
Weight (kg)	90°	0.67	1.55
	180°	0.64	1.48
Sensor switch (*3)	RDF(V), RNF(V): NPN, RPF(V): PNP		

*1. The maximum operating pressure of the actuator is restricted by the maximum allowable thrust of the shock absorber.

*2. For stable operation the time required for the rotary table to reach the rotation end after deceleration differs depending on the operating conditions (inertial moment of the load, rotation speed, and operating pressure), however, approximately 0.2 to 2 seconds are required.

*3. RDF specification, please refer to page 5-10.

Range of shock absorber operates

Model	Adjustment angle per rotation of angle adjustment screw	Range of angle the shock absorber operates (single side)
MCRQ-S-15	1.5°	12°
MCRQ-S-20	1.1°	9°
MCRQ-S-25	1.3°	11°

MRTH Male pivot gear (standard type)

MRTH-D Male pivot gear (double end rod type)

MRTF Female pivot gear

Features

- Hard anodised aluminium body is standard.
- Clean lines with high functionality.
- Carbon steel rack and pinion with low backlash.
- Simple adjustment of rotary movement.
- Magnetic as standard.

Specification

Model	MRTF, MRTH, MRTH-D		
Tube I.D. (mm)	40	63	80
Standard rotation (mm)	90±5°, 180±5°
